Figure 3 Frontend UI after showing a successful prediction .....	5
Figure 4 Frontend UI after showing a successful prediction .....	6
Figure 5 Confusion Matrix.....	6
Figure 6 Accuracy .....	7

## 1) Project Idea

- Classify incoming SMS messages as spam or ham (not spam).
- Audience: learners and teams needing a simple, demonstrable NLP product.

## 2) Dataset

- SMS Spam Collection (public dataset)
  - UCI page: <https://archive.ics.uci.edu/ml/datasets/SMS+Spam+Collection>
  - Training script auto-downloads from public mirrors or uses a small fallback sample.

## 3) ML Pipeline & Model

- TfIdfVectorizer (uni+bi-grams, English stopwords) + LogisticRegression (liblinear, class\_weight=balanced).
- Code: ml\_pipeline/train.py
- Model artifact: backend/model/sms\_spam\_model.joblib

## 4) Final Model Performance

- Accuracy (current run): 1.00
- Full metrics JSON: artifacts/metrics.json
- Confusion Matrix:

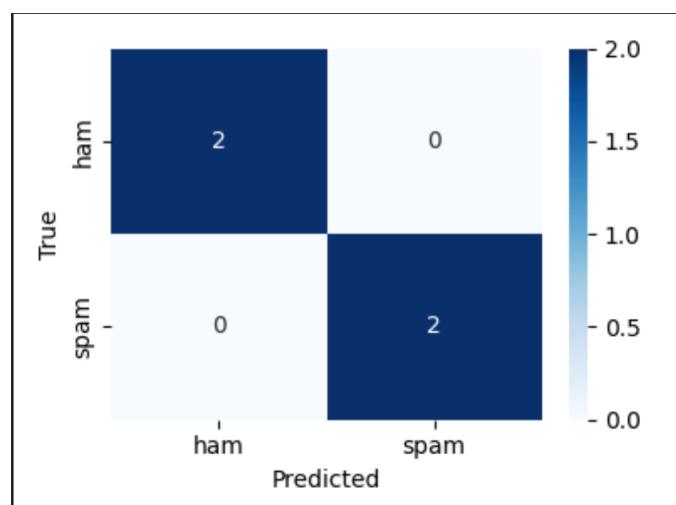

Figure 1 Confusion Matrix

## 5) Product Architecture

- ML: ml\_pipeline/train.py produces a serialized model and metrics.
- Backend: FastAPI app in backend/app.py with POST /predict.
- Frontend: simple HTML/CSS/JS in frontend/ that calls /predict.

## 6) Screenshots (Required)

### 1. Frontend UI before prediction:

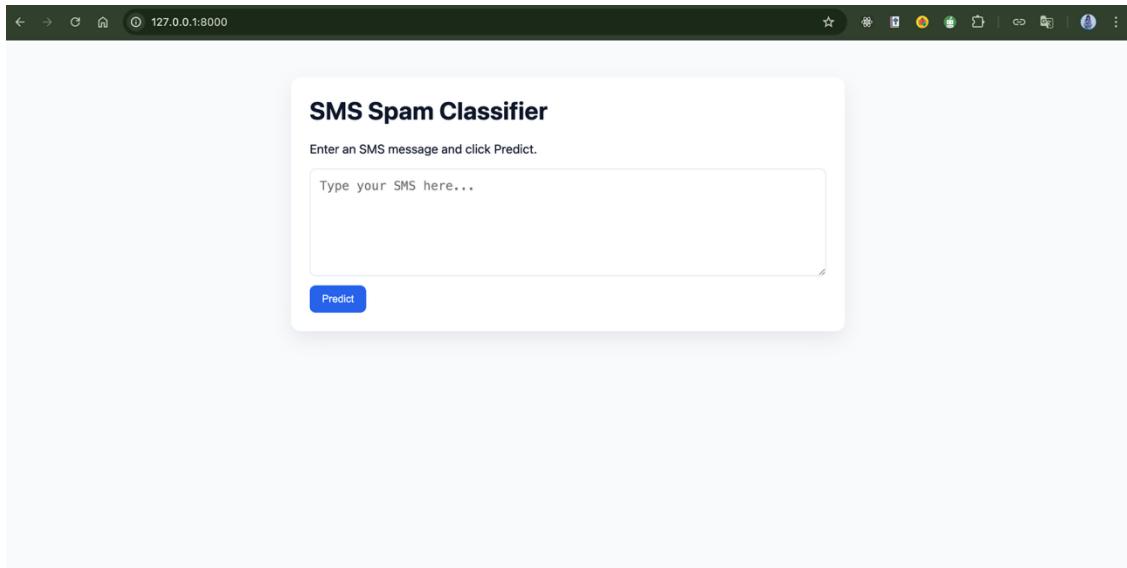

Figure 2 Frontend UI before prediction

### 2. Frontend UI after showing a successful prediction:

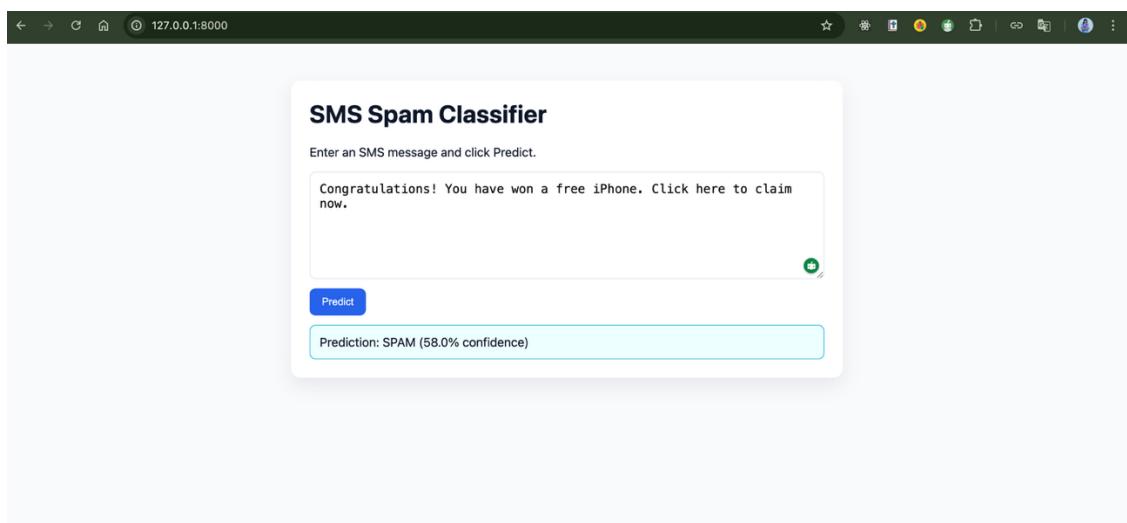

Figure 3 Frontend UI after showing a successful prediction

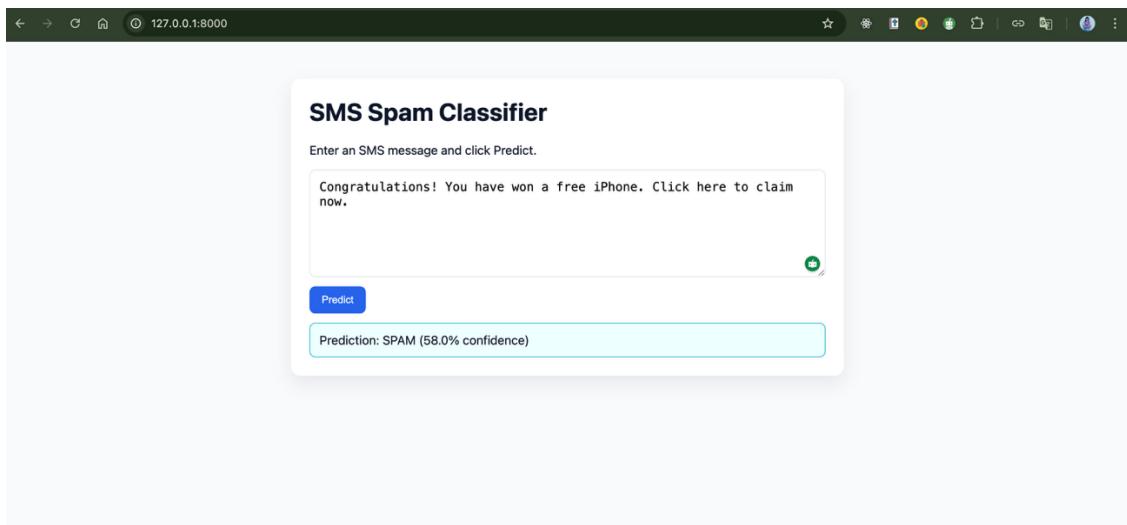

Figure 4 Frontend UI after showing a successful prediction

### 3. ML pipeline evaluation metrics:

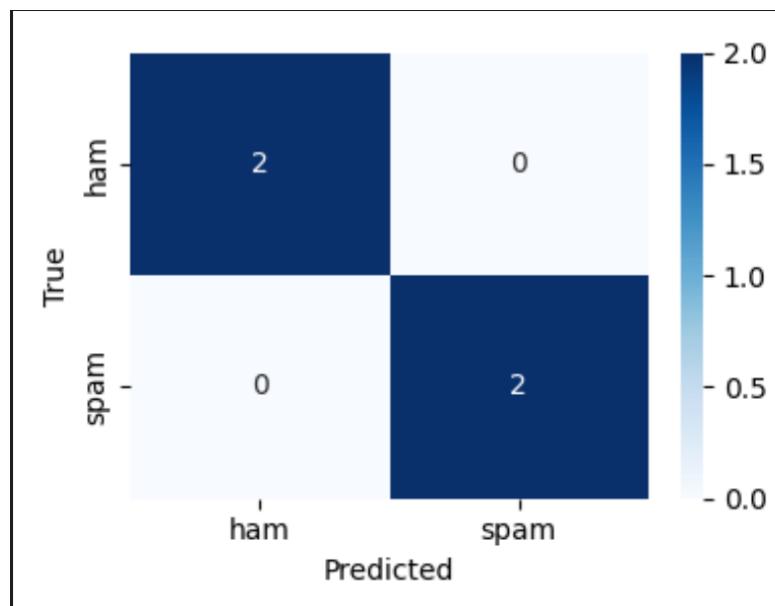

Figure 5 Confusion Matrix

```

artifacts > {} metrics.json > ...

## 7) How to Run (Summary)

**bash**

```
python3 -m venv .venv
```

```
.venv/bin/pip install --upgrade pip
```

```
.venv/bin/pip install -r requirements.txt
```

**# optional training (server will auto-train if needed)**

```
.venv/bin/python ml_pipeline/train.py
```

**# run server**

```
.venv/bin/uvicorn backend.app:app --reload
```

**Open: <http://127.0.0.1:8000>**

## 8) API Example

**Request:**

**bash**

```
curl -s -X POST http://127.0.0.1:8000/predict \
```

```
-H 'Content-Type: application/json' \
-d '{"text":"Congratulations! You have won a free iPhone. Click here to claim now."}'
```

**Response (example):**

```
json
{ "label": "spam", "probability": 0.58 }
```

## 9) Notes

- Artifacts are under artifacts/.
- The backend serves the frontend; no extra static server is needed.
- Swap dataset/parameters in ml\_pipeline/train.py for experiments.
